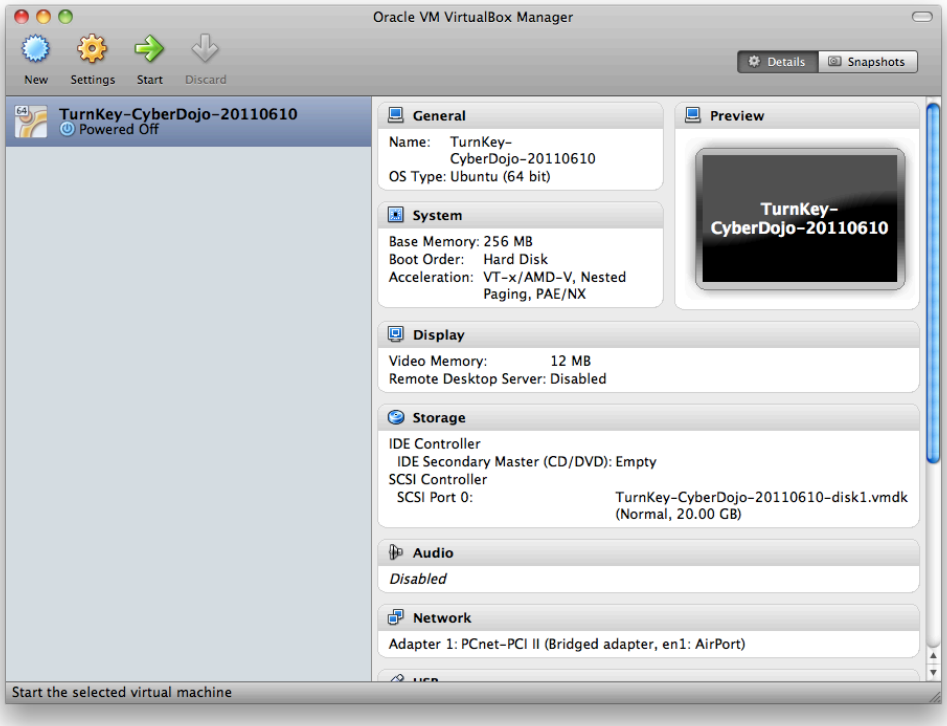
Run your own CyberDojo!

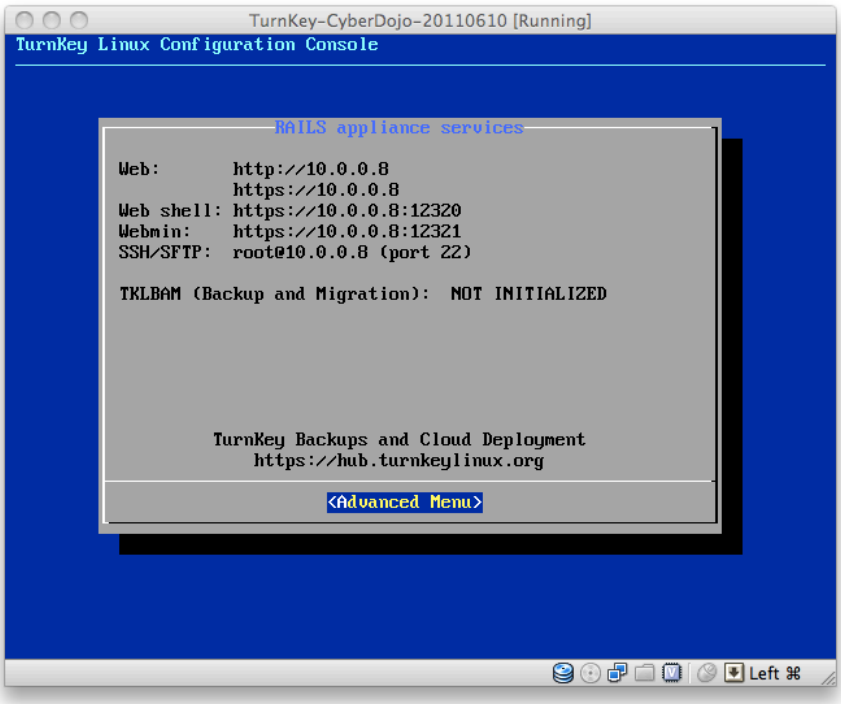
Download the cyberdojo virtual machine image from here:
http://dl.dropbox.com/u/22404698/TurnKey-CyberDojo-20110610.ova

You will need to install VitualBox to run the virtual machine. You can get it here:
http://www.virtualbox.org/

Once you have virtualbox installed you can double click on the CyberDojo ova file. This will launch the virtualbox application and import the virtual machine. Click start to launch the VM. On my MacBook Air I needed to configure the network interface to match my settings first.



When the virtual machine starts running you are given an opportunity to set the network parameters:

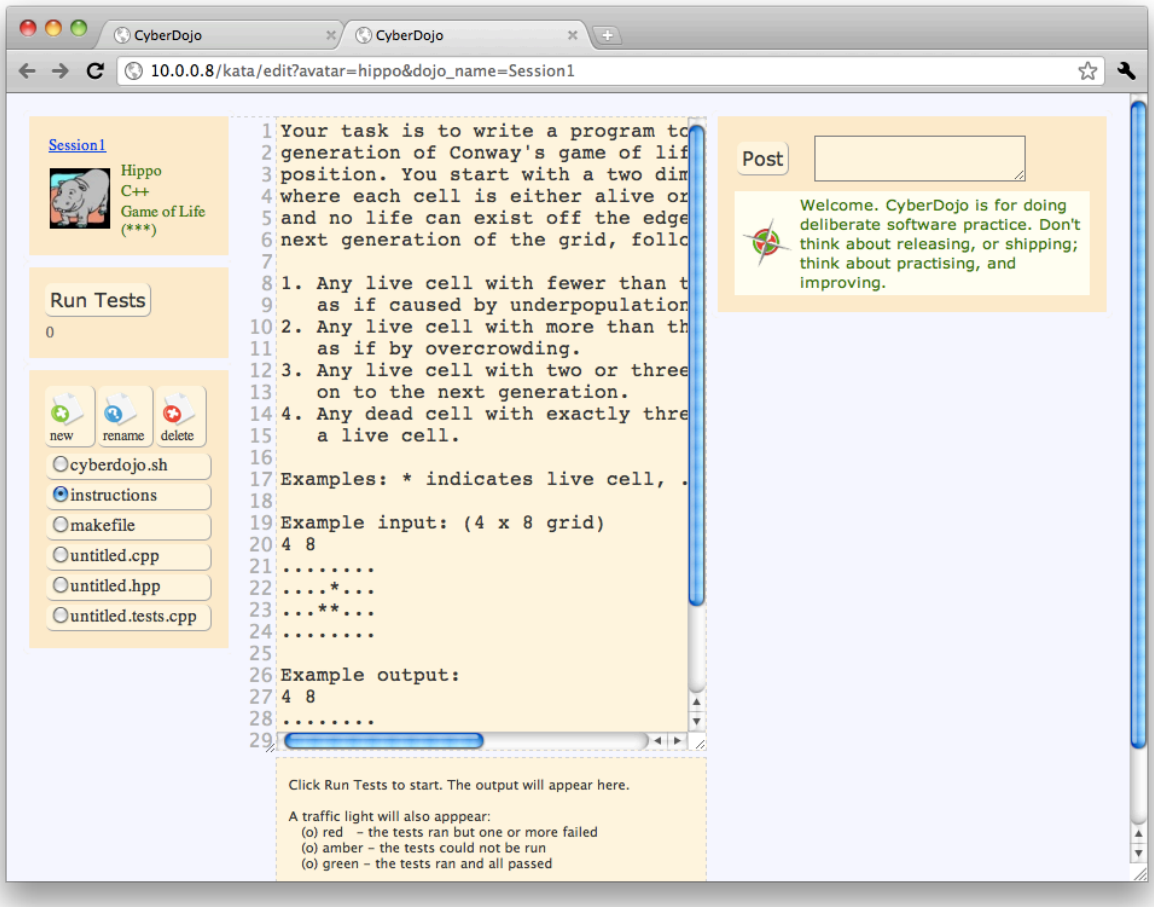


Then you can log in using these credentials:

```
username: root
password: super
```

Then from any machine on your local network you can point your browser at 10.0.0.8 and you should see the following page:

Give your CyberDojo session a name and select “Configure It”.
Then you can select the task to work and choose languages available.



To give you a taste of how it works, here is a video of Jon doing the roman numerals kata:
